Beating Ransomware With Proper Cloud Architecture

As the United States emerges from the coronavirus lockdown, digital experts are combating a “pandemic of a different variety,” as the former head of U.S. cybersecurity Chris Krebs warned in May.

On several occasions in the past seven months, ransomware attacks have shut down large sectors of the American economy, with hackers taking advantage of lax security measures for an easy payday. The concept is fairly simple: Hackers use malicious software to break

into and encrypt a company's data, then hold it ransom until the victim pays up, often in seven-figure installments.

This is an interesting article we found on the Internet, which we want to share with you. While there are many publications, checklists, and blueprints available to help plan your ransomware mitigation strategy, this article explores **using modern cloud-native computing** tools and techniques in order to secure your business computing environment and make it more recoverable. Enjoy!
